

Cold and hot mist (aerosols and ready-to-use preparations)

Nebulization is a very effective method to control flying and crawling insects, because the preparation gets to the pest and not vice versa. It is a kind of forced poisoning. In the area of storage protection, we also offer you preparations, which may be used in the presence of storage qualities - without prior covering. Thus, for example a control of moths in the silo is problem-free and rule compliant feasible.

Furthermore, we recommend the "emaciation" - method in order not to give populations the "chance" to reproduce.

Our INSEKTENIL®-Naturpyrethrum-Spray, the only fumigant without PBO approved by the BVL in Germany, which can be used even in the presence of open stored goods (up to 10 times) and additionally complies with the standards of the organic associations, should also be highlighted. Included in the "FiBL" list for ecological agriculture, it is THE preparation for use in organic farms.
